

CLAIMS

I claim:

13. What is new is a cultivating disk, the design, being simple and functional, allows the cultivating disk to be manufactured in a complete form in a one step punch press operation; thereby, making it very economical to produce.
14. The cultivator/ weeder/ trimmer disk, being interchangeable with the string weeder assembly of most existing weeder/trimmer implements in current use, enables these weeder/trimmer implements, without further modification, to be used as cultivators; thus making them much more versatile.
15. What is an improvement over existing cultivator/weeder/trimmer implements is its simplified none clogging design with no sharp edges, no tines to get entangled with weeds, roots, and/or Debris yet capable of cultivating, cutting of short or tall weeds, and shredding without changing disks.
16. Said design, being a complimentary add on, consisting of a thin high carbon steel disk with a punched center hole (for mounting) and three punched rectangular lugs which protrude from one side of the disk at a 90-degree angle and are equally spaced along the outer circumference of the disk about 1/2 inch inward from the outer edge.
